

Deep Learning

Review
UG-4, Aug 2025-26
Shaik Mohammad Rafi B

Intelligence

the ability to understand, learn and think

Natural/Real
Intelligence

Artificial Intelligence

human-defined rules

Machine Learning

Statistical ML

ANNs

GMMs, HMMs etc

Deep Learning

Raw data

Documents

1Dim: Articles, records, stories, poems

Images

2Dim: Photographs, satellite, thermal, medical

Numbers

1Dim: EEG, ECG, Seismic, weather, stock market

Sounds

1Dim: Speech, Music, bird/animal, Vehicles etc

Features & patterns

Features:
Measurable descriptors of an entity

Pattern:
Systematic arrangement or combination of features

Feature learning through Deep Neural Nets

Machine Learning

Deep Learning

Feed Forward Neural Network

Convolutional Neural network

Input

Image patch
(Local receptive field)

*

Kernel
(filter)

Output

Convolution Operation

Multi channel convolution: Sum of responses

Convolutional Neural network

Recurrent Neural Network

Recurrent Neural Network

Sentiment Analysis

LSTM replaces RNN cell to avoid vanishing and exploding gradients through gating mechanism.

Generative Adversarial Network

Generative Adversarial Network

Diffusion Models

Deep Generative models: Generate real data from noise

- The goal of the model is to detect the added noise and reconstruct the previous image.
- The predicted image is then compared to the actual image to calculate the loss.

- The noisy image at step t and the value of t itself is input to the model.
- The model predicts the noise that was added to the image to get it to that state.
- Mean Squared Error (MSE) between the *actual* noise added and the *predicted* noise.

Reconstruction: Once trained, to "reconstruct" or generate an image, we start with pure noise at $t=T$.

- The model predicts the noise in the current image.
- We subtract a portion of that predicted noise to get a "slightly cleaner" image ($t-1$).
- We repeat this iteratively until we reach $t=0$

Self Attention in DNNs

Self Attention in DNNs

Self Attention in DNNs

The FBI is chasing a criminal on the run .

Self Attention in DNNs

$$\text{softmax} \left(\frac{\begin{matrix} \text{Anthony} & \text{Hopkins} & \text{admired} & \text{Michael} & \text{Bay} & \text{as} & \text{a} & \text{great} & \text{director.} \\ \left[\begin{matrix} \text{Q} \end{matrix} \end{matrix} \right] \times \left[\begin{matrix} \text{Anthony} & \text{Hopkins} & \text{admired} & \text{Michael} & \text{Bay} & \text{as} & \text{a} & \text{great} & \text{director.} \\ \text{K} \end{matrix} \right]}{\sqrt{d_k}} \right) =$$

Importantly, the sum of each row is 1.

Anthony Hopkins admired Michael Bay as a great director

$\text{softmax} \left(\frac{\begin{matrix} \text{Anthony} \\ \text{Hopkins} \\ \text{admired} \\ \text{Michael} \\ \text{Bay} \\ \text{as} \\ \text{a} \\ \text{great} \\ \text{director.} \end{matrix} \begin{bmatrix} Q \end{bmatrix} \times \begin{bmatrix} K \end{bmatrix}}{\sqrt{d_k}} \right) =$

Importantly, the sum of each row is 1.

$\begin{bmatrix} V^T \end{bmatrix} \times \begin{bmatrix} \text{row vector} \end{bmatrix} =$

The sum of the reweighted "values."

$$\text{softmax} \left(\frac{\begin{matrix} \text{Anthony} \\ \text{Hopkins} \\ \text{admired} \\ \text{Michael} \\ \text{Bay} \\ \text{as} \\ \text{a} \\ \text{great} \\ \text{director.} \end{matrix} \begin{bmatrix} Q \end{bmatrix} \times \begin{bmatrix} \text{Anthony} \\ \text{Hopkins} \\ \text{admired} \\ \text{Michael} \\ \text{Bay} \\ \text{as} \\ \text{a} \\ \text{great} \\ \text{director.} \end{bmatrix} K}{\sqrt{d_k}} \right) =$$

Importantly, the sum of each row is 1.

$$V^T \cdot \text{softmax} \left(\frac{QK^T}{\sqrt{d_k}} \right)^T =$$

64-dim

9-dim

9-dim

64-dim

Each column of this product is a reweighted token.

Transformer

Decoding time step: 1 2 3 4 5 6

OUTPUT |

Autoencoder: Un-supervised Speech representations

Wav2Vec: self-supervised Speech representations

Objective: Maximize mutual information between C_t and z_{t+k}

$$\mathcal{L}_k = - \sum_{i=1}^{T-k} \left(\log \sigma(\mathbf{z}_{i+k}^\top h_k(\mathbf{c}_i)) + \lambda \mathbb{E}_{\tilde{\mathbf{z}} \sim p_n} [\log \sigma(-\tilde{\mathbf{z}}^\top h_k(\mathbf{c}_i))] \right)$$

Encoder and decoder; 1DCNN layers

Few Popular Architectures

- **ResNet:**
 - CNNs with skip Connections
 - Object classification
- **RCNNs:**
 - Region based CNNs
 - Face detection, Object tracking, Image Captioning
- **U-Net:**
 - CNNs as AutoEncoder
 - Image Segmentation, Remote sensing
- **Time Delay Neural Networks:**
 - 1D CNNs with time dilations
 - Speech Recognition, speaker ID
- **Siamese Network:**
 - RNNs/CNNs with Contrastive learning
 - Signature Verification
